Are Fears of Trump's tariffs overblown?

Highlights from last week's market action and news:

- The S&P 500 stock price index collapsed 9.08% last week. RSI and MACD are extremely oversold. Trading volume spiked up to an extremely high level, suggesting a selling climax.
- The NASDAQ 100 ETF (QQQ) and Small-capitalization stocks (IWM) confirm a deeply oversold stock market condition.
- The Percentage of S&P 500 stocks above their own 50-day and 200-day SMAs fell to the deepest oversold reading in more than a year.
- The number of Net New Highs is at its lowest level since 2022, confirming extreme weakness and an oversold market condition.
- The Cumulative Advance-Delay Issues Line indicates a bullish divergence compared to the price indexes.
- Gold reversed to the downside following bearish momentum divergence.
- Gold Miners ETF (GDX) turned systematically neutral when price fell below its 50-day SMA.
- Copper fell steeply last week. "Dr. Copper" is widely thought to be a leading indicator of global economic conditions, with a better forecasting record than some Ph.D. economists.
- Foreign stock indexes (EFA, EEM, and FXI) turned systematically neutral when prices crossed below 50-day SMAs.

- Crude Oil (\$WTIC) is systematically bearish again—but RSI, MACD, and OBV are not as weak as Price, for a bullish divergence.
- US dollar (\$USD) is trending down but has lost some of its downside momentum.
- iShares Core U.S. Aggregate Bond ETF (AGG) rose to its highest price of the year thanks to safe-haven demand for government debt securities as stock prices plunged last week.
- Bitcoin ETF (IBIT) Price remains systematically neutral.
- Energy Sector SPDR (XLE) turned systematically bearish when the 50-day Simple Moving Average (SMA) crossed below the 200-day SMA.
- Consumer Staples Sector SPDR (XLP) and Utilities Sector SPDR (XLU) turned systematically neutral when price fell below its 50-day SMA.
- Stock indexes rose on Monday, Tuesday, and Wednesday but dramatically collapsed on Thursday and Friday following Trump's announcement of new tariffs.
- On Friday, Fed Chair Powell said the economic impact of new tariffs is likely to be significantly larger than expected and may lead to slower growth and higher inflation.
- Treasury Secretary Scott Bessent said the era of trade imbalances is over, the US will no longer tolerate unfair treatment, and Trump's trade policies are rooted in historical precedent and strategic calculation. In trade negotiations, the massive American consumer economy has the advantage over producer nations that need to sell surplus goods here. Americans should buy American, and foreign countries that need to sell goods in the US should eliminate their own tariffs.
- The economic data reports were mixed and were largely ignored because investors were much more concerned about anticipating the future than reviewing the past.
- The following reports were better-than-expected: US March MNI Chicago PMI, construction spending, ADP employment change, Feb factory orders, initial unemployment claims, US March nonfarm payrolls, and US March average hourly earnings.
- The following reports were worse-than-expected: US Dallas Fed manufacturing activity outlook survey, JOLTS job openings, ISM manufacturing, ISM prices paid sub-index, continuing unemployment claims, US ISM services index, and the March unemployment rate.

The bullish case for market stock price gains:

- Sentiment indicators (\$VIX volatility, AAll bears, and the CNN Fear & Greed Index) now signal even greater **Extreme Fear**, which is bullish according to *The Art of Contrary Opinion*.
- Fear of Trump's tariffs may be overblown.
- Extremely high trading volume on Friday suggests a capitulation and selling climax.
- This stock price downside correction has knocked down stock market valuations to reasonable levels from overvalued, overpriced levels.
- Short-term downside shakeouts are to be expected in any bull market.
- Following the previous 15 downside corrections going back to 2008, the S&P 500 rose more than 15%, on average, over the next 12 months, according to Dow Jones Market Data.

- The downside correction from the 6147.43 peak of the S&P 500 on 2/19/2025 looks like an Elliot Wave ABC three-wave reaction (down, up, down) against the larger degree bull market trend. If so, the stock market should bounce back very soon.
- Hedge funds are the most bearish in the 5 years since 2020, according to Goldman Sachs. These funds are “weak hands” traders who will quickly buy to cover shorts and buy long as soon as they detect that the price trend has turned to up from down.
- According to the latest survey from Bank of America, investors cut their US stock holdings by 40 percentage points from the previous survey, the most on record, from 17% overweight in February to 23% underweight in March, while cash levels have risen to 4.1% from 3.5%, the biggest jump since 2020.
- CPI inflation has come way down, to below 3% from a peak rate of 9% for June, 2022.
- The Federal Reserve Board has begun to lower short-term interest rates, although the Fed appears to be in no hurry to lower rates and the path forward is data dependent and therefore uncertain.
- Consumer spending and the economy have remained remarkably resilient.
- The Conference Board’s Leading Economic Index® (LEI) for the US “no longer signals an impending recession.”
- Corporations are buying back their own stocks.
- The Trump administration is expected to promote business-friendly, pro-growth economic policies, with lower corporate taxes, looser regulations, and reduced red tape.
- A growing economy, resilient consumer spending, and a strong jobs market would support rising corporate profits.
- New US tariffs on imports of foreign goods could make US products more competitive and thereby increase demand for US products, stimulate investment in US production capacity, increase US GDP, and increase US tax revenue.
- Elon Musk’s DOGE is trying to reign in out-of-control government deficit spending, which could cut budget deficits and help limit interest expense on government debt and help limit inflation.
- Negotiations to end the Ukraine war could save tens of thousands of lives and save US taxpayers many billions of dollars.
- Artificial intelligence could usher in a new era of productivity and profits.
- Geopolitics has threatened to be the biggest tail risk to markets for many months, but Trump appears determined to make new deals for peace and prosperity.

The bearish case for a cautious stock market strategy:

- Many investors fear that Trump’s tariffs, tax cuts, and immigrant deportations could increase inflation in the short-term, worsen geopolitical tensions, lead to global trade wars that disrupt supply chains, depress global business and corporate earnings, and lead to a recession.
- Elon Musk’s DOGE faces opposition from Democrat politicians and judges--a roadblock facing the pro-growth Trump agenda.
- University of Michigan’s 5-Year Inflation Expectations and the Conference Board’s index of consumers’ expectations for inflation over the next 12 months have been rising.

- The Conference Board US Consumer Expectations Index for March dropped 9.6 points to 65.2, the lowest level in 12 years and well below the threshold of 80 that usually signals a recession ahead.
- The Conference Board Leading Economic Index® (LEI) for the US declined by 0.3% for February. In light of substantial policy uncertainty, the CB forecasts real GDP growth could slow to around 2.0% in 2025.
- Longer term, inflation may remain stubbornly high due to tight labor markets reflecting an aging work force with fewer working-age adults, climate change costs, more expensive green energy, the cost of delayed replacement of aging infrastructure, geopolitical risks to supply chains, trade restrictions, and out-of-control government deficit spending.
- Heavy supplies of new bond offerings and rising inflation could mean higher-than-hoped-for interest rates.
- Some investors fear that the speculative enthusiasm for artificial intelligence might be overblown, the hoped-for benefits might not pan out, and AI could outsmart us and go rogue.

Every day, we use technical, fundamental, and quantitative analysis to judge the Reward/Risk probabilities of trend continuation or reversal. We control risks to make sure that all of our clients are safe and protected from major losses. If you want to earn reasonable returns while avoiding large losses, move your wealth to our professional fiduciary asset management. We always put our clients' best interests first, and we are always here to help you in times of stress.

iShares Core U.S. Aggregate Bond ETF (AGG) rose to its highest price of the year thanks to safe-haven demand for government debt securities as stock prices plunged. On-Balance Volume (OBV) confirmed the upside price breakout. RSI and MACD short-term price momentum indicators also rose but remain below their March highs. Longer term, AGG remains systematically neutral, above the 50-day Simple Moving Average (SMA), above the 200-day SMA, but with the 50-day SMA still below the 200-day SMA. AGG has underperformed \$SPX since 2009 and may continue to underperform so long as inflation remains high.

The S&P 500 stock price index (symbol: \$SPX 5,074.08) collapsed 9.08% last week. RSI at 23.25 is extremely oversold. MACD indicates a deeply oversold market condition, as deep as in bear market year 2022. On-Balance Volume (OBV) remains much stronger than price, suggesting developing bullish divergence. Sentiment indicators (which generally follow the price trend) are showing **Extreme Fear**, which is bullish according to *The Art of Contrary Opinion*. \$SPX remains systematically neutral, with price below the 50-day Simple Moving Average (SMA), price below the 200-day SMA, and with the 50-day SMA well above the 200-day SMA. The downside correction from the 6147.43 peak of the S&P 500 on 2/19/2025 looks like an Elliot Wave ABC three-wave reaction (down, up, down) against the larger degree bull market trend. If so, the stock market should bounce back very soon.

The equal-weight ETF of S&P 500 (RSP) reversed to the downside after testing resistance near the 200-day SMA. RSI, MACD, and On-Balance Volume (OBV) have been confirming significant Price weakness. RSP turned systematically neutral on 3/3/2025 when price crossed below the 50-day SMA. Long term, RSP has underperformed \$SPX since 2015.

The Percentage of S&P 500 stocks above their own 50-day SMAs, now at 13.0%, fell to its deepest oversold reading in more than a year.

The Percentage of S&P 500 stocks above their own 200-day SMAs, now at 23.4%, fell to its deepest oversold reading in more than a year.

The number of Net New Highs (\$NYHL), now at -769, is technically bearish. It is bearish when it is less than zero, that is, when New Lows outnumber New Highs. \$NYHL is at its lowest level since 2022, confirming extreme weakness and an oversold market condition.

The Cumulative Advance-Decline Issues Line turned systematically neutral when it fell below the 50-day SMA—but a bullish divergence is evident compared to the price indexes. The S&P 500 and other major indexes fell far below their January lows, but the A-D line did not confirm by breaking down below its January low.

The NASDAQ 100 ETF (QQQ) remains weak. Price, RSI, and OBV confirmed extreme downside momentum as they fell steeply to deeply oversold levels. The QQQ trend turned systematically neutral when Price crossed below the 50-day SMA on 2/24/2025. QQQ underperformed \$SPX since 12/16/2024--but long term, QQQ has outperformed \$SPX since 2002.

Small-capitalization stocks (IWM) are signaling deeply oversold. Price, RSI, MACD, and OBV confirm significant downside momentum and a deeply oversold market condition. This ETF has been ignoring the investor consensus that small-caps remain undervalued relative to the large-cap favorite stocks, probably reflecting fears that a weakening economy could impact small caps to a greater extent than large caps. The price trend turned systematically bearish when the 50-day Simple Moving Average (SMA) crossed below the 200-day SMA on 3/20/2025. Long term, IWM has underperformed \$SPX since 2008.

Gold reversed to the downside following bearish momentum divergence. RSI and MACD rose to high overbought extremes in February, but they made lower highs in March as Price continued to rise to higher highs, thereby indicating bearish momentum divergence. Gold turned systematically bullish on 1/8/2025 when price rose above its 50-day Simple Moving Average (SMA). Although price has been rising since 1999, Gold has underperformed \$SPX since 2011. Fundamentally, governments have been reluctant to admit that inflation is caused by uncontrolled government spending and mushrooming levels of debt. Inflation is bearish for the purchasing power of fiat currencies but bullish for gold, which has a long tradition as a safe haven during times of inflation and financial instability. Declining interest rates could be bullish for gold, while rising interest rates are bearish.

Copper fell steeply last week. RSI and MACD confirmed a downturn in short-term momentum. OBV is stronger than Price, however, suggesting bullish divergence. Copper turned systematically bullish on 3/3/2025 when the 50-day SMA crossed above the 200-day SMA. Long term, Copper has underperformed \$SPX since 2011. “Dr. Copper” is widely thought to be a leading indicator of global economic conditions, with a better forecasting record than some Ph.D. economists.

EFA turned systematically neutral when Price crossed below its 50-day SMA. Price, RSI, MACD, and OBV all confirm a major loss of momentum. EFA, which tracks the stock markets of developed nations excluding the US, underperformed the \$SPX for 17 years since year 2008 and may continue to underperform the \$SPX over the longer term. Americans just work harder than Europeans because Americans have a higher general level of ambition, according to Nicolai Tangen, CEO of Norway's \$1.6 trillion oil fund. The greater the level of socialism, the less ambition to strive and compete.

Chinese stock price index ETF (FXI) turned systematically neutral when Price crossed below its 50-day SMA. Price, RSI, MACD, and OBV all confirm a significant loss of momentum. Price action in the short-term remains vulnerable to further shocks because it depends on economic policy announcements by both the Chinese Communist Party and the US. Longer term, iShares China Large-Cap ETF (FXI) underperformed the \$SPX for 17 years since 2007 and may continue to underperform the \$SPX over the longer term.

Crude Oil (\$WTIC) is systematically bearish again—but Crude Oil has found support around the many previous lows in the 63-68 zone over the past 2 years. RSI, MACD, and OBV are not as weak as Price, for a bullish divergence. Nevertheless, Crude Oil remains systematically bearish, with price below its 50-day SMA, price below its 200-day SMA, and with the 50-day SMA below the 200-day SMA. Lower Crude prices would help to alleviate some inflation fears, but higher Crude prices would fan the flames of inflation.

US dollar (\$USD) is trending down but has lost some of its downside momentum. Short-term momentum indicators RSI and MACD are not as weak as Price, for a possible bullish divergence. The price trend turned systematically neutral when price crossed below the 50-day SMA on 2/12/2025.

Bitcoin ETF (IBIT) Price remains systematically neutral. Price, RSI, MACD, and OBV lost downside momentum in recent weeks but have yet to signal much upside momentum. The longer trend remains systematically neutral below its 50-day SMA.

Both Dow-Jones Averages confirmed lower highs and lower lows since peaking last November, and the trend-following Dow Theory now looks more bearish. A bullish major uptrend requires the Averages to trend together, with both rising to higher highs. A bearish major downtrend requires both Averages to fall to lower lows. On 3/10/2025, both the Industrial Average and the Transportation Average confirmed a weaker trend when they closed below their January closing price lows. And on 4/4/2025, both Averages fell to much lower lows, their lowest levels in 10 months.

Short-term ***sentiment indicators*** (which generally follow the price trend) show greater ***Fear***, which is bullish according to ***The Art of Contrary Opinion***.

The CNN Fear & Greed Index, now at 4, has signaled ***Extreme Fear*** since 2/25/2025.

\$VIX volatility confirmed ***Extreme Fear*** this month when it rose to its highest level since last August, 2024.

AAll Bears (!AIIIBEAR) rose to extremely high levels, suggesting ***Extreme Fear***.

NAAIM Equity Exposure (!NAAIM) fell to its lowest levels in more than a year, suggesting *Fear*.

The Put/Call Ratio (!PCRATEQU) rose to its highest level in nearly a year, suggesting *Fear*.

Real Estate Sector SPDR (XLRE) turned systematically bearish when the 50-day Simple Moving Average (SMA) crossed below the 200-day SMA on 2/19/2025. XLRE has underperformed \$SPX since 9/10/2024. Long term, XLRE has underperformed \$SPX since 2016 but has outperformed since 2001. XLRE is often an early leader in the typical stock-market cycle.

Technology Sector SPDR (XLK) turned systematically bearish when the 50-day Simple Moving Average (SMA) crossed below the 200-day SMA. XLK has underperformed since July 2024 but still has outperformed since 2003. XLK is often an early leader in the typical stock-market cycle.

Communication Services Sector SPDR (XLC) turned systematically neutral when price fell below its 50-day SMA. XLC has outperformed \$SPX since 2008. XLC is often an early leader in the typical stock-market cycle.

Consumer Discretionary Sector SPDR (XLY) turned systematically neutral when price fell below its 50-day SMA. XLY has outperformed since 2001. XLY is often an early leader in the typical stock-market cycle.

Industrial Sector SPDR (XLI) turned systematically neutral when price fell below its 50-day SMA. XLI underperformed \$SPX since 2018. XLI is often an early leader in the typical stock-market cycle.

Materials Sector SPDR (XLB) turned systematically bearish again when price closed below its 50-day SMA. XLB has underperformed \$SPX since 2008. XLB is often an early leader in the typical stock-market cycle.

Energy Sector SPDR (XLE) turned systematically bearish when the 50-day Simple Moving Average (SMA) crossed below the 200-day SMA. XLE has underperformed \$SPX since 2008. XLE often moves after the early-cycle leaders but before the late-cycle leaders in the typical stock-market cycle.

Consumer Staples Sector SPDR (XLP) turned systematically neutral when price crossed below its 50-day SMA. XLP has underperformed \$SPX since 2008. XLP is often a late-cycle leader in the typical stock-market cycle.

Health Care Sector SPDR (XLV) remains systematically bearish with price below its 50-day and 200-day SMAs and the 50 below the 200. Long term, XLV has underperformed \$SPX since 2015. XLV is often a late-cycle leader in the typical stock-market cycle.

Utilities Sector SPDR (XLU) turned systematically neutral when price fell below its 50-day SMA. XLU has underperformed \$SPX since 2008. XLU is often a late-cycle leader in the typical stock-market cycle.

Financial Sector SPDR (XLF) turned systematically neutral when price fell below its 50-day SMA. Long term, XLF has underperformed \$SPX since 2006. XLF is often a late-cycle leader in the typical stock-market cycle.

Gold Miners ETF (GDX) turned systematically neutral when price fell below its 50-day SMA. GDX outperformed \$SPX since December 2024 but still underperformed \$SPX since 2011. GDX is often completely uncorrelated to the typical stock-market cycle.

37 major market leaders, objectively ranked in order of long-term Relative Strength:

Rank	Symbol	Index Name, Relative Strength Ranks	CLOSE	C/50 SMA	C/200 SMA	50/200

10	XLB	SPDR MTRLS SELCT	77.88	-10.98%	-13.72%	-3.08%

The table above shows our quantitative Relative Strength Rankings ("Rank", to the left) together with ratios of pure price performance in the 3 different time frames that are most relevant to investors: medium term (CLOSE/50 SMA), longer term (CLOSE/200 SMA), and major trend (50/200, shown at the extreme right). SMA is an abbreviation for Simple Moving Average.

A security is in a bullish position (trending upward in price) when all 3 time frames are in agreement in positive positions relative to their SMAs. Bullish trends are displayed in green.

A security is in a bearish position (trending downward in price) when all 3 time frames are in agreement in negative positions relative to their SMAs. Bearish trends are displayed in red.

Sectors Ranked above 50 (as shown in the 1st column to the left) are demonstrating above-average Relative Strength, according to our completely objective quantitative algorithm. Those are the sectors most likely to outperform going forward. Sectors Ranked below 50 are demonstrating below-average Relative Strength and are most likely to underperform going forward.

The 3 columns on the right offer a perspective on sector strength measured over multiple time frames. They quantify each sectors' absolute price strength relative to the most widely-accepted simple moving averages (SMAs), expressed as a percentage of a shorter time period price divided by a longer time period's average price. C/50 is the latest closing price (C) divided by the 50-day SMA, and it indicates a medium-term view of the price trend. C/200 is the latest closing price (C) divided by the 200-day SMA and indicates a longer-term view. The major trend view is shown by the 50/200, which is the 50-day SMA divided by the 200-day SMA. These 3 ratios offer different views of the strength of each sector measured over 3 different time frames.

Investors seeking to maximize returns should concentrate in the higher-ranked, strongest sectors while avoiding the lower-ranked, underperforming sectors. Relative Strength has worked very well for many decades, outperforming nearly every other method of stock selection.

Top 10 ETFs, objectively ranked in order of long-term Relative Strength:

This list, updated each week, outperformed the S&P 500 since August, 2004, in simulation.

To arrive at our Top 10 ETFs selections, we first measure trend momentum of each ETF over a long time frame spanning many months, according to our objective formula. Next, we rank 143 of the most important ETFs, from highest to lowest. Finally, we select the ten highest-ranked, best-performing ETFs, the ones with the strongest major trend price momentum.

Research studies suggest that ETFs ranked in the top decile may have a greater probability of outperforming the market in the months ahead, while low ranked ETFs may have a greater probability of underperforming.

For details on Relative Strength Ranking, please see Robert W. Colby's book, ***The Encyclopedia of Technical Market Indicators***, Second Edition (2003), pages 604-609, or see our White Paper, ***"Introduction to the Screening Method for Analysis of Relative Strength"***, by Robert W. Colby, CMT, outlining some of the research behind our Relative Strength Ranking Method.

Please note that this is a high-volatility strategy: the stocks that go up the most when the stock market is in a Bullish trend often **go down the most during market corrections to the downside**. In addition, please note that this Top 10 list is a research study and is not investment advice. Your use of this report means that you have read, understood, and accepted our Disclaimer on the last 2 pages of this report.

Rank	Stock Relative Strength Rank	Symbol	CLOSE	C/50 SMA	C/200 SMA	50/200
99	ISH CHINA LG CAP	FXI	32.74	-6.58%	7.48%	15.06%

143 Select Exchange Traded Funds (ETFs), objectively ranked in order of long-term Relative Strength:

This list is filtered to exclude leveraged and inactive ETFs trading less than 90,000 shares a day on average. Ranks are based on our updated version of the Screening Method for Analysis of Relative Strength, using a proprietary formula, which measures trend momentum over a long time frame spanning many months. For details on Relative Strength Ranking, please see Robert W. Colby's book, ***The Encyclopedia of Technical Market Indicators***, Second Edition (2003), pages 604-609, or see our White Paper, ***"Introduction to the Screening Method for Analysis of Relative Strength"***, by Robert W. Colby, CMT, outlining some of the research behind our Relative Strength Ranking Method. Research studies suggest that ETFs ranked in the top decile (highest tenth) of the list may have a greater probability of outperforming the market in the months ahead, while low ranked ETFs have a greater probability of underperforming.

The global debt load surges higher and higher, adding risk to the global financial system. *Unsustainable* growth in debt has blown the greatest debt bubble of all time and has put the economy and financial system at risk. According to the Institute of International Finance, global debt held by households, governments, and financial and nonfinancial corporations **soared by \$94.2 trillion or 42.6% over the past eight years to a record \$315.1 trillion.** That debt is 333% of global gross domestic product. In addition, the number of "stressed" firms that can't cover their interest expense has been rising. When people, corporations, and governments spend more than they earn, debt grows faster than the economy, and the mountain of debt keeps rising higher and higher. When the next recession arrives (sooner or later there is always another recession), incomes decline and rising numbers of borrowers no longer will be able to make payments on their debts. When overextended borrowers (whose numbers are large and growing) are unable to make loan payments, debt defaults mushroom, leading to general systemic financial distress. Interconnected financial intuitions fail in a chain reaction, and the global financial system freezes up, like it did in 2008. It could be like *deja vu all over again*, or worse, because the debt load is so much larger now.

Stay safe. Thanks to decades of fiscal and monetary malpractice leading to excessive spending, speculation, and misallocation of economic resources, the global financial system has been loaded up with excessive debt, leverage, bad "assets", and hidden insolvency. US cities (Detroit, Stockton) and sovereign nations (Greece, Cyprus, Argentina) have had to admit they are bankrupt and can't pay their debts--and there appear to be other major entities that are trying to cover up their financial weakness. Although central banks print trillions of units of fiat currency (which they pass off as "money") out of thin air and backed by nothing at all, in an effort to keep the global financial system from collapsing, currency inflation not only failed to fix the underlying problems, but actually exacerbated the imbalances in the real global economy and, thereby, escalated risks. Debasing the currency is only the first step, which then can be followed by suspending pension payments, imposing capital controls, raising taxes, and bailing in banks by seizing part or all of customers' bank deposits.

Now is the time to take action. A rising trend of stock prices led to bullish investor sentiment most of the time since the Great Depression market bottom in 1932--but that is only an extrapolation of past performance, and it is no guarantee of rising stock prices going forward. On the contrary, excessive bullish optimism is often a sign that a market top is near. Place your assets under our careful management--**before** the next episode in the ongoing world financial crises hits most portfolios. Make no mistake, the ongoing global economic and financial crisis has not been fixed by any sound or lasting solution. And history shows that governing authorities cannot protect you or give you any advance warning--**but we will.**

Given the known serious and stubborn economic and financial troubles that defy solutions and create major risks for the outlook ahead, we offer a **risk-averse strategy** for clients' accounts we manage. Our **Safety-First** program, which emphasizes **absolute return on capital with low risk of major capital loss**, could prove most beneficial to your net worth in years ahead. To learn more about our proprietary [**Safety-First Portfolio**](#), [click here](#).

If you want to participate in the stock market during the good times, and then ***automatically*** shift away from stocks when stock prices are trending down, we have a program for that too: our proprietary ***[Dynamic Allocation Shifting Strategy](#)***, [click here](#).

If you agree that making money while staying safe is better than taking *uncontrolled* risks in the stock market and exposing your nest egg to potentially ruinous losses, we would be very happy to implement our time-tested strategies for all of your assets. It makes good sense to choose protection--especially at this time when the financial world is stretched out of proportion.

We are always happy to discuss your goals and concerns and answer all your questions.
Call us now for a free consultation.

Defining Multiple Time Frames For Classifying Trends: It is important to understand that markets often display very different and conflicting trends, depending on the specific time period analyzed. Nearly a century ago, the Dow Theory established a useful way to organize time/trend information. In harmony with the Dow Theory, we organize our analysis into 5 different time frames, as follows:

Intraday moves and trends that last only a few days. These price *jiggles* are too small, too random, and change too frequently to be useful to anyone except for elite professional traders or algorithms.

Short-term trends typically last a few weeks, more or less. These trends change frequently, often in reaction to the latest news and rumors, and so they are fickle and unreliable. The Dow Theory views these minor *Ripples* as *insignificant noise*. Although skillful traders may be able to profit from short-term price movements, most investors cannot. The S&P 500 has crossed its 20-day SMA every 25 calendar days on average over the past 50 years, roughly matching this short-term trend.

Medium-term trends last more than a few weeks and often a few months. 3 weeks to 3 months is common, but they could stretch out much longer. These *intermediate* or *secondary* trends are often consolidations or corrections against (opposite to) the direction of the major trend. The medium-term trend can move price from several percentage points up 10% or a bit more. The S&P 500 has crossed its 50-day SMA every 6.1 weeks on average over the past 50 years, matching this trend.

Longer-term trends last a few months, sometimes longer. Prices can move 10%-20% or more. The S&P 500 crossed its 200-day SMA every 3.5 months on average over the past 50 years.

Major trends are very big moves that last for years. Prices can move 30%, 50%, or more. The major trend is also known as the *primary*, *dominant*, and *main* trend. ***Major trends are highly significant for all traders and investors.*** We always trade in the direction of the major trend, buying long in bull markets and selling long or selling short in bear markets, because that puts the probability of making money in our favor. Trading opposite to the major trend (that is, buying long in a bear market or selling short in a bull market) would put the odds against us and can lead to disastrous losses. All traders and investors can profit by trading in the same direction as the most important major trend. For the S&P 500, the 50-day crossed the 200-day SMA every 23 months on average over the past 50 years, roughly matching this major trend.

Relative Strength: Both academic studies and long experience show that probabilities favor buying the strongest trading instruments/investments and avoiding the weak and lagging ones. Although nothing in the markets works every time, buying and holding the strongest instruments has produced above-average returns most years and is one of the very best methods for selecting specific regions, countries, sectors, industries, stocks, bonds, tangible assets, etc. in which to invest.

Investor Sentiment is mainly useful for short-term, counter-trend trading. Markets are complex adaptive systems that reflect the emotions of the crowd reacting to contradictory and incomplete information as well as changing decision rules. Prices tend to swing to emotional extremes of optimism and pessimism. When there is a great majority of bulls, few investors are left to buy, and rallies suddenly can fizzle and reverse. Conversely, when there is a majority of bears, few investors are left to sell, and short-squeeze rallies suddenly can appear seemingly out of nowhere. Moderate sentiment tends to coincide with uncertain, indecisive markets. Note that sentiment extremes are often early, and momentum can sustain a trend in motion beyond sentiment extremes. *The Art of Contrary Opinion* is *not a science*: it is an *art* lacking consistent rules.

Robert W. Colby Asset Management, Inc. (Colby) hereby certifies that the views expressed in this research report accurately reflect the personal views of the Company's Chief Investment Officer, Robert W. Colby, CMT, and/or other trained members of Colby, about any and all of the subject markets or securities, and further certifies that no part of the compensation of Colby was, is, or will be directly or indirectly related to the recommendations or views in this report. Colby is engaged in investment management as well as the conduct and publication of professional-quality, independent technical analysis research and, as a matter of policy, always makes best efforts to be as objective and unbiased as possible.

Any and all statements referring to Robert W. Colby Asset Management, Inc., performance are intended to be accurate and complete and to disclose all material facts necessary to avoid any unwarranted inference. Any and all investment performance data shown reflect all accounts in our recommended investment program. (Some clients, at their own choosing, may hold securities that are not included in our recommended investment program, or they may choose to deviate from our program in some other way; therefore, their performance results may deviate from our recommended investment program, for better or worse, and are not included in our performance data.) Our performance data reflects the deduction of advisory fees, brokerage or other commissions and fees, and any other expenses that accounts have actually paid. Our performance data reflects the reinvestment of dividends, interest, and other earnings. Our investment strategies and all fees are explained on our website and in our disclosure documents and also are available on request.

The industry standard benchmark for performance comparison is generally the S&P 500 Index, although that and all other price indexes have certain limitations in that they differ from our recommended investment program in volatility, asset mix, diversification/concentration, dividends, interest, trading costs, fees, and other factors. Unlike the S&P 500 Index, which passively reflects the price performance of 500 large-capitalization stocks, our recommended investment program is concentrated in relatively few securities and actively aims first for capital preservation and second for capital appreciation. We work continuously to achieve these goals. We try to anticipate and adapt to change. Regulators point out that there can never be any guarantees in investing; there is always risk and the possibility of loss; changing market conditions are beyond anyone's control; and past performance is not a guide to future performance.

Colby's technical analysis is prepared using widely-available public data that is generally accepted as reasonably reliable, although Colby cannot guarantee accuracy or completeness of data and analysis and no representation is made to that effect. Colby's technical analysis is based primarily on analysis of the current price and volume performance of a security relative to other securities and in the context of its historical patterns of performance, in accordance with the Body of Knowledge and Code of Ethics endorsed by the CMT Association, the globally-recognized, professional regulatory organization for technical analysts established in 1973. See: <https://cmtassociation.org/>

Investments discussed in this report are not suitable for all investors. This report does not take into account the investment objectives, financial situation or specific needs of any particular investor. Every investor should consider whether any suggestion or recommendation is appropriate given his particular circumstances. Technical analysis alone should not be relied upon as the sole basis for making investment decisions. All publicly available information regarding the security in question should be reviewed, including the fundamentals of the security and other information provided in any filings with the Securities and Exchange Commission (SEC).

Although persons and companies associated with Colby may from time to time hold positions in securities mentioned in these research reports, Colby's policy proscribes any employee activity that would conflict with client interests.
